Owning Satellit

KLE-Online  
Owning Satellite is not connected. Monitor status is unknown.

**Settings**

After the computer starts, wait  seconds before starting monitors in order to help the computer 'settle down' quicker.

When the service starts, ignore all actions that are fired on the first check of each monitor (in order to skip all of the 'already-known' events that happen at startup). The Last Status will show 'Skipping Actions' in this case.

Alert and report language:

All new monitors should automatically start in Training Mode (when applicable)

The PA Server Monitor service is set to run as:

Local System (an internal account that can only access this computer)

The following user:  Password:  Domain:  [Remote monitoring hints \[user account considerations\]...](#)

Target average CPU usage: 20% 10%  90%

Check for updates every 30 days

Alert when Support & Maintenance is about to expire

[\[Privacy\]](#)

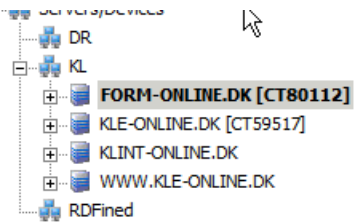

Note: The notifications types are configured in System Alerts (above to the right)

Log files:

Max log file size in KB:   Enable Debug logging  Enable Data logging

Lock the monitoring service so it cannot be stopped

OK  
Cancel

### Performance Counters Not Loaded

The monitoring service was unable to retrieve a list of counters. This is usually caused by missing credentials (either Windows or SNMP) for the server, or a failure to communicate with the monitoring service.
